## **basebox raises €0.5m for fast and secure digitization**

The software company basebox GmbH, founded by the software developer Markus Thielen and digital expert René Herzer, has closed a pre-seed round of €500,000.

The funding was supported by Quidam Beteiligungsgesellschaft and business angel Johanna Konrad.

basebox, based in the Munich area, was founded in July 2022 to help ensure that innovations in heavily regulated areas can be developed faster and more cost-effectively.

### **Often underestimated: the secure data management system**

In recent years, the importance of security and compliance has continued to grow. Companies must adhere to increasingly strict rules to ensure that customer data is protected. At the same time, the threat of cyberattacks is growing.

"It's not a lack of talent and expertise to develop an innovative product, but a lack of powerful, secure and compliant infrastructure that costs little time and money. basebox is a ready-to-use infrastructure for software developers. A so-called backend. On this basis, teams can focus on innovation development instead of the backend" says René Herzer, founder of basebox.

### **Increasing of compliance and security in critical areas**

Efficient data management system development encounters complex requirements in data-sensitive sectors such as healthcare, administration, defense and mobility. Until now, developers have had to choose between quick deployment and high security. This compromise is now over. With basebox, anyone can implement a secure data management system: Self-hosted, Rust-based and off-the-shelf. Universally applicable thanks to the integrated GraphQL API.

"Teams now have the time to do what productively advances their project, because the requirements for regulation, security and performance have already been implemented," explains Markus Thielen, founder of basebox. The result: More efficiency and planning security for software teams in data-sensitive sectors.

### **Saving time and money with basebox**

basebox can be installed in an afternoon, saving teams up to 8 months of time and 90% of backend development budget.

### **Launch in March 2023**

After 20 months of development, the first version of basebox will be released in March 2023.
